

Michigan Center for Nursing Survey of Nurses 2013

Survey Instrument and Response Frequencies for Registered Nurses Employed in the Southeast Health Service Area

The Michigan Center for Nursing conducted the 10th annual survey of licensed nurses in 2013 to collect data on their employment status, geographic distribution, age, plans to continue practicing, work setting, practice area, specialty certification, education, gender, and racial/ethnic background. In 2013, the survey instrument also includes questions regarding changes in employment to examine the movement of nurses between inpatient and outpatient positions and primary care and specialty positions; to learn nurses' perceptions of participation on an interdisciplinary patient care team and the role they serve on a team; and to learn how many advanced practice registered nurses hold a Drug Enforcement Agency (DEA) and/or National Provider Identifier (NPI) number (asked online only). This report presents the survey responses for registered nurses who entered a Southeast zip code for their primary place of employment. A map of the health service areas can be found in the appendix for this report. Unless otherwise noted, response frequencies are for *active* nurses only, i.e., nurses who are working in nursing or a related area on a full-time or part-time basis.

There were 6,147 surveys returned from RNs employed in the Southeast health service area, yielding a margin of error of ± 1.2 percent with 95 percent confidence for data for RNs in this health service area. Comparison of data across different health service areas is not recommended because the number of responses and corresponding margin of error vary among health service areas. An analysis of data by service area was completed in 2007 and 2011; the findings are included in this report for comparison.

The complete report, *Michigan Center for Nursing Survey of Nurses 2013*, presents findings for the Michigan population of nurses as a whole and is available online at www.michigancenterfornursing.org.

Michigan Center for Nursing Survey of Nurses 2013

Survey Instrument and Response Frequencies for Licensed Practical Nurses Employed in the Southeast Health Service Area

The Michigan Center for Nursing conducted the 10th annual survey of licensed nurses in 2013 to collect data on their employment status, geographic distribution, age, plans to continue practicing, work setting, practice area, education, gender, and racial/ethnic background. In 2013, the survey instrument also includes questions regarding changes in employment to examine the movement of nurses between inpatient and outpatient positions and primary care and specialty positions and to learn nurses' perceptions of participation on an interdisciplinary patient care team and the role they serve on a team. This report presents the survey responses for licensed practical nurses who entered a Southeast zip code for their primary place of employment. A map of the health service areas can be found in the appendix for this report. Unless otherwise noted, response frequencies are for *active* nurses only, i.e., nurses who are working in nursing or a related area on a full-time or part-time basis.

There were 644 surveys returned from LPNs employed in the Southeast health service area, yielding a margin of error of ± 3.9 percent with 95 percent confidence for data for LPNs in this health service area. Comparison of data across different health service areas is not recommended because the number of responses and corresponding margin of error vary among health service areas. An analysis of data by service area was completed in 2007 and 2011; the findings are included in this report for comparison.

The complete report, *Michigan Center for Nursing Survey of Nurses 2013*, presents findings for the Michigan population of nurses as a whole and is available online at www.michigancenterfornursing.org.
